

What does your TRT protocol entail?

- 1. Consultation to determine the likelihood a patient has low testosterone.**
- 2. Screening laboratory evaluations to help determine that possible diagnosis.**
- 3. Provision of all supplies needed: medication, syringes/needles/alcohol wipes, etc. (and clear instructions on how to best deliver the medications)**
- 4. Quarterly lab evaluations for surveillance of effective levels and tracking of potential side effects (increased blood volumes and increased estrogen levels)**
- 5. Quarterly (perhaps more often if needed) reviews of treatment with a provider.**
- 6. Regular access to your providers for questions (emails, texts, calls) or more information.**
- 7. Creation of LabCorp accounts so you can track, view, and possibly share your own results.**
- 8. Any discussions your other physicians might want / need to have with our physicians.**
- 9. Any other aspect of care that enhances the outcomes for the unique individual patient.**
